Motivation

Consider an algorithmic problem e.g. Vertex colouring:

A **proper colouring** is an assignment of colours to the vertices of a graph such that no two adjacent vertices get the same colour.

A colouring using at most k colours is a k -colouring.

The Vertex Colouring Problem

Input: A graph G and an integer k

Question: Does G have a proper k -colouring?

This problem is **NP-complete**, even if $k = 3$.

What happens when the input is restricted to a **class** of graphs?

Motivation

Consider an algorithmic problem e.g. Vertex colouring:

A **proper colouring** is an assignment of colours to the vertices of a graph such that no two adjacent vertices get the same colour.

A colouring using at most k colours is a **k -colouring**.

The Vertex Colouring Problem

Hereditary Classes

A graph H is an **induced subgraph** of G if H can be obtained by deleting vertices of G , written $H \subseteq_i G$.

P_4

$3P_1$

$P_1 + P_2$

So $P_1 + P_2 \subseteq_i P_4$, but $3P_1 \not\subseteq_i P_4$.

A class of graphs is **hereditary** if it is closed under taking induced subgraphs.

Let S be a set of graphs. The class of **S -free** graphs is the set of graphs that do not contain any graph in S as an induced subgraph.

Hereditary Classes

A graph H is an **induced subgraph** of G if H can be obtained by deleting vertices of G , written $H \subseteq_i G$.

P_4

$3P_1$

$P_1 + P_2$

So $P_1 + P_2 \subseteq_i P_4$, but $3P_1 \not\subseteq_i P_4$.

A class of graphs is **hereditary** if it is closed under taking induced subgraphs.

Let S be a set of graphs. The class of **S -free** graphs is the set of graphs that do not contain any graph in S as an induced subgraph.

Colouring H -free graphs

Theorem (Král', Kratochvíl, Tuza & Woeginger, 2001)

The Vertex Colouring problem is polynomial-time solvable for H -free graphs if and only if $H \subseteq_i P_1 + P_3$ or P_4 , otherwise it is NP-complete.

$P_1 + P_3$

P_4

Clique-width

Theorem (Courcelle, Makowsky & Rotics 2000, Kobler & Rotics 2003, Rao 2007, Oum 2008, Grohe & Schweitzer 2015)

Any problem expressible in “monadic second-order logic with quantification over vertices” (and certain other classes of problems) can be solved in polynomial time on graphs of bounded clique-width.

This includes:

- ▶ **Vertex Colouring**
- ▶ Maximum Independent Set
- ▶ Graph Isomorphism
- ▶ Minimum Dominating Set
- ▶ Hamilton Path/Cycle
- ▶ Partitioning into Perfect Graphs
- ▶ ...

Clique-width

The clique-width is the **minimum number of labels** needed to construct G by using the following four operations:

- (i) creating a new graph consisting of a single vertex v with label i (represented by $i(v)$)
- (ii) taking the disjoint union of two labelled graphs G_1 and G_2 (represented by $G_1 \oplus G_2$)
- (iii) joining each vertex with label i to each vertex with label j ($i \neq j$) (represented by $\eta_{i,j}$)
- (iv) renaming label i to j (represented by $\rho_{i \rightarrow j}$)

For example, P_4 has clique-width **3**.

Clique-width

$$\eta_{3,2}(3(d) \oplus \rho_{3 \rightarrow 2}(\rho_{2 \rightarrow 1}(\eta_{3,2}(3(c) \oplus \eta_{2,1}(2(b) \oplus 1(a))))))$$

Why clique-width?

- ▶ “Equivalent” to rank-width and NLC-width
- ▶ Generalises tree-width
- ▶ “Equivalent” to tree-width on graphs of bounded degree

The following operations don't change the clique-width by “too much”

- ▶ Complementation
- ▶ Bipartite complementation
- ▶ Vertex deletion
- ▶ Edge subdivision (for graphs of bounded-degree)

Need only look at graphs that are

- ▶ prime
- ▶ 2-connected

Which classes have bounded clique-width?

If the class of H -free graphs has bounded clique-width then every component of H must be a subdivided claw, path or isolated vertex. The set of such graphs is called \mathcal{S} .

$S_{1,2,3}$

P_5

P_1

H -free graphs

Theorem (D., Paulusma 2015)

The class of H -free graphs has bounded clique-width if and only if $H \subseteq_i P_4$.

The classification of boundedness of clique-width on (H_1, H_2) -free graphs is known for all but five open cases.

Complexity of Vertex Colouring on (H_1, H_2) -free graphs is open for infinitely many cases.

Complexity of Vertex Colouring on (H_1, H_2) -free graphs is open for **infinitely** many cases.

Atoms

A graph is an **atom** if it has no **clique cut-set**.

For a hereditary class \mathcal{H} , we can solve the Vertex Colouring problem on **graphs** in \mathcal{H} in polynomial time if we can do so for **atoms** in \mathcal{H} .

A vertex is **simplicial** if its **neighbourhood is a clique**.

If a graph is an **atom**, then it is either a **clique**, or it has **no simplicial vertices**.

For what classes of graphs does **no simplicial vertex imply** the graph is an **atom**?

Atoms

A graph is an **atom** if it has no **clique cut-set**.

A vertex is **simplicial** if its **neighbourhood is a clique**.

If a graph is an **atom**, then it is either a **clique**, or it has **no simplicial vertices**.

For what classes of graphs does **no simplicial vertex imply** the graph is an **atom**?

Split Graphs

A graph is **split** if its vertices can be partitioned into an **independent set** and a **clique**.

Equivalently, split graphs are the $(2P_2, C_4, C_5)$ -free graphs.

Every **split** graph has a **simplicial vertex**, so **split atoms** are **cliques**.

Also works for **chordal graphs**.

A class is **nice** if all **connected** graphs in it with **no simplicial vertices** are **atoms**.

Theorem (D., Paulusma 21+)

The class of **H-free** graphs is **nice** if and only if it is a subclass of: **$2P_2$ -free** graphs or **P_3 -free** graphs.

Theorem (D., Paulusma 21+)

The class of **(H_1, H_2) -free** graphs is **nice** if and only if it is a subclass of:

- ▶ **$2P_2$ -free** graphs
- ▶ **P_3 -free** graphs
- ▶ **$(P_1 + P_3, \overline{\text{sunlet}_4})$ -free** graphs
- ▶ **$(P_4, \overline{P_1 + 2C_4})$ -free** graphs
- ▶ **$(P_5, \overline{2P_1 + P_2})$ -free** graphs
- ▶ **$(P_5, \overline{P_1 + P_3})$ -free** graphs
- ▶ **$(C_4, 2P_3)$ -free** graphs or
- ▶ **$(K_{1,3}, \overline{\text{banner}})$ -free** graphs

Are there classes which have **unbounded** clique-width, but whose **atoms** have **bounded** clique-width?

Theorem

The class of **H -free atoms** has bounded clique-width if and only if $H \subseteq_i P_4$.

- ▶ **NO** such cases for **H -free** graphs.
- ▶ **YES**: split graphs
- ▶ **YES**: chordal graphs
- ▶ **YES**: (cap, C_4) -free odd-signable graphs (Cameron, da Silva, Huang, Vušković, 2018)
- ▶ **YES**: (C_4, P_6) -free graphs (Gaspers, Huang, Paulusma, 2019)

What about (H_1, H_2) -free graphs?

Are there classes which have **unbounded** clique-width, but whose **atoms** have **bounded** clique-width?

Theorem

The class of **H -free atoms** has bounded clique-width if and only if $H \subseteq_i P_4$.

- ▶ **NO** such cases for **H -free** graphs.
- ▶ **YES**: split graphs
- ▶ **YES**: chordal graphs

- ▶ **YES**: (C_4, P_6) -free graphs (Gaspers, Huang, Paulusma, 2019)

What about **(H_1, H_2) -free** graphs?

$(2P_2, \overline{P_2 + P_3})$ -free Atoms Have Bounded Clique-width

- ▶ $(2P_2, \overline{P_2 + P_3})$ -free **graphs** generalise split $((C_4, C_5, 2P_2)$ -free) graphs, so have unbounded clique-width
- ▶ $(2P_2, \overline{P_2 + P_3})$ -free **atoms** containing an induced C_5
- ▶ $(C_5, 2P_2, \overline{P_2 + P_3})$ -free **atoms** containing an induced C_4
- ▶ $(C_4, C_5, 2P_2, \overline{P_2 + P_3})$ -free **atoms** are a subclass of **split** graphs

$(2P_2, \overline{P_5})$ -free Atoms Have Unbounded Clique-width

- ▶ Take a **split** graph ($(2P_2, C_4, C_5)$ -free, **arbitrarily large** clique-width)
- ▶ Add **two non-adjacent vertices** that are **complete** to the graph
- ▶ Result is a $(2P_2, \overline{P_5})$ -free atom of **arbitrarily large** clique-width

Open Problem

Does the class of (H_1, H_2) -free atoms have bounded clique-width if

- (i) $H_1 = \text{diamond}$ and $H_2 = P_6$
- (ii) $H_1 = C_4$ and $H_2 \in \{P_1 + 2P_2, P_2 + P_4, 3P_2\}$
- (iii) $H_1 = \overline{P_1 + 2P_2}$ and $H_2 \in \{2P_2, P_2 + P_3, P_5\}$
- (iv) $H_1 = \overline{P_2 + P_3}$ and $H_2 \in \{P_2 + P_3, P_5\}$
- * (v) $H_1 = K_3$ and $H_2 \in \{P_1 + S_{1,1,3}, S_{1,2,3}\}$
- * (vi) $H_1 = 3P_1$ and $H_2 = \overline{P_1 + S_{1,1,3}}$
- * (vii) $H_1 = \text{diamond}$ and $H_2 \in \{P_1 + P_2 + P_3, P_1 + P_5\}$
- * (viii) $H_1 = 2P_1 + P_2$ and $H_2 \in \{\overline{P_1 + P_2 + P_3}, \overline{P_1 + P_5}\}$
- * (ix) $H_1 = \text{gem}$ and $H_2 = P_2 + P_3$, or
- * (x) $H_1 = P_1 + P_4$ and $H_2 = \overline{P_2 + P_3}$.

* means boundedness of clique-width is **open** for the whole class of (H_1, H_2) -free graphs

Summary

- ▶ Systematically studied boundedness of clique-width on (H_1, H_2) -free atoms
- ▶ 1 new bounded class
- ▶ Lots of unbounded classes
- ▶ There are 18* classes of (H_1, H_2) -free atoms for which boundedness of clique-width remains open
- ▶ There are 5* classes of (H_1, H_2) -free graphs for which boundedness of clique-width remains open

Further details: <https://arxiv.org/abs/2006.03578>
